

EXPERIMENT 5

Building Reports, Dashboards and Custom Pages for the Application in Zoho Creator

Hotel Management System - Booking Sales, Dashboard & Custom Page Use Case

Submitted by

AKASH SUNDAR

Aim

To design and build functional reports, dashboards, and a custom page in Zoho Creator that consolidate and visualise the booking data captured by the Hotel_Booking_Form, enabling the front office and sales team to monitor booking-pipeline progress, room-type demand, and check-in timing at a glance.

Problem Statement

The Hotel_Booking_Form built in Experiment 4 now captures every new booking request in a structured record, but the front office and management still have no consolidated way to review this data. Scanning submissions one record at a time makes it difficult to see how many bookings are sitting with each department, which room types are most in demand, how booking volume is spread across upcoming check-in dates, or which special requests guests most commonly report.

Design a reporting and analytics layer on top of the existing booking data that lets the front office view submissions grouped by processing department, and lets managers and the sales team see, at a glance, guest age distribution, room-type popularity, upcoming check-in trends, and common guest requests — all through a native Zoho Creator List Report, a Dashboard of chart widgets, and a consolidated Custom Page.

Procedure

1. Log into Zoho Creator and open the existing “Hotel Booking & Reservation Management” application built in Experiment 4.
2. Create a List Report named “Booking_Sales” on the Hotel_Booking_Form and group records by the Processing_Department field so submissions appear under Sales, Marketing, Operations, Finance, and Packaging tabs.
3. Add report columns for Guest Name, Age, Processing Department, Email Address, Contact Number, Billing Address, and Guest Requests/Notes so front-office staff can scan key details without opening each record.
4. Create a Dashboard page and add four chart widgets sourced from the same form: a bar chart comparing booking counts across Processing_Department and Age, a pie chart showing the distribution of Preferred_Room_Type choices, a bar chart plotting Preferred_Checkin_Date against Guest_Requests_Notes, and a radar chart summarising total bookings by Preferred_Checkin_Date.

5. Configure each widget’s data source, category and value fields, and colour legend, and set report and dashboard permissions so Front Office staff and the Sales team can view but not edit the configuration.
6. Build a Custom Page named “HMS” that embeds the List Report and the Dashboard widgets together into a single consolidated screen for daily front-office use.
7. Preview the live report, dashboard, and custom page; verify that the sample booking records from Experiment 4 render correctly in every widget; and confirm that switching department tabs on the report updates the record list as expected.

Data Model

This exercise does not introduce a new data table; the report, dashboard, and custom page all read from the same Hotel_Booking_Form record set created in Experiment 4. The List Report (Booking_Sales) presents these records grouped by Processing_Department. The Dashboard aggregates the same records into chart widgets keyed on Age, Preferred_Room_Type, Preferred_Checkin_Date, and Guest_Requests_Notes. The Custom Page (HMS) then combines the List Report and the Dashboard widgets into one consolidated view so the front office does not need to navigate between separate report and dashboard pages during daily operations.

Report & Dashboard Structure

Section	Key Components	Purpose
List Report	Booking_Sales, grouped by Processing_Department	Provides a filterable, department-grouped view of every booking for quick front-office lookup.
Dashboard – Booking Overview	Bar chart (Age by Processing Department), Pie chart (Preferred Room Type)	Summarises how many bookings sit in each department stage and which room types are in demand.
Dashboard – Trends & Preferences	Bar chart (Preferred Check-in Date vs Guest Requests), Radar chart (Total Bookings by Check-in Date)	Highlights upcoming check-in volume and common guest requests for operations planning.
Custom Page	HMS page combining the List Report and all Dashboard widgets	Gives front office and management a single consolidated screen for daily booking review.

Report, Dashboard and Custom Page Components and Their Mapping

The table below maps every reporting component built in this exercise to its configured name, purpose, and a sample insight it surfaces.

Component	Name	Purpose	Sample Insight
List Report	Booking_Sales	Displays every submitted booking grouped into Sales / Marketing / Operations / Finance / Packaging tabs.	Records spread across 5 department tabs
Bar Chart	Age_by_Processing_Department	Compares total booking counts across each department stage.	Marketing: highest count
Pie Chart	Preferred_Room_Type_Distribution	Shows the share of guests who prefer each room type.	Deluxe & Suite rooms most requested
Bar Chart	Age_Distribution_New_Bookings	Plots the age spread specifically among new bookings.	Count axis 0–90
Bar Chart	Checkin_Date_vs_Guest_Requests	Groups each guest's stated request against their preferred check-in date.	"Early check-in requested..." etc.
Radar Chart	Total_Bookings_by_Checkin_Date	Visualises how booking volume is spread across upcoming preferred check-in dates.	20-Aug to 01-Oct-2026
Custom Page	HMS	Combines the List Report and all Dashboard widgets into one consolidated screen.	Front-office daily-use screen

Explanation of Screenshots

The following screenshots illustrate the complete workflow: configuring the List Report and Dashboard widgets in Zoho Creator, viewing the live report and dashboard, and reviewing the consolidated custom page.

1. The Report - Booking Sales (Grouped by Department)

The live List Report displays every submitted booking grouped into Sales, Marketing, Operations, Finance, and Packaging tabs, with each record card showing the booking's reference number and code so the front office can quickly scan and select a record.

Fig. 1 – Booking Sales Report, grouped by Processing Department

2. Input - Zoho Creator Report & Dashboard Builder

The builder view should show the Report/Dashboard component palette alongside the configured Booking_Sales report and Dashboard widgets. The properties panel should show the grouping field, chart type, category and value fields, and colour legend for the selected widget.

3. The Dashboard - Booking & Room-Type Overview

The first part of the live Dashboard should combine the grouped report panel with two summary charts: a bar chart comparing booking counts across Processing_Department and Age, and a pie chart showing how guests are distributed across the available Preferred_Room_Type options.

Dept. of Computer Science and Engineering | Rajalakshmi Engineering College

4. The Dashboard - Trends, Preferences and Output Data

The second part of the live Dashboard should capture the age distribution among new bookings, a bar chart plotting Preferred_Checkin_Date against each guest's stated Guest_Requests_Notes, and a radar chart summarising total bookings across upcoming preferred check-in dates — giving the sales team a forward view of incoming booking volume.

Result:

The Report, Dashboard, and Custom Page for the Hotel Booking & Reservation Management application were successfully designed and implemented in Zoho Creator on top of the Hotel_Booking_Form built in Experiment 4. The Booking_Sales report groups every submission by Processing_Department, and the Dashboard visualises booking counts, room-type preferences, age distribution, and check-in date trends through bar, pie, and radar chart widgets. Sample booking records were verified across every report and dashboard view, and a consolidated Custom Page (HMS) was configured to bring the report and dashboard together, demonstrating a functional analytics layer for the hotel's front-office operations.
